MINERAL PRODUCTION IN ILLINOIS IN 1964

W. L. Busch

ABSTRACT

The value of minerals produced in Illinois in 1964 amounted to 618 million dollars. This total was the second highest annual value ever recorded for mineral production in this state. Illinois minerals include coal, oil, stone, sand and gravel, fluorspar, lead, zinc, and other items such as clay products, cement, and lime. The total annual value of these minerals has been in excess of 600 million dollars for each year, 1956-1964. The quantity and value of minerals produced in 1964 are summarized in the tables and maps of this report.

SUMMARY OF 1964 MINERAL PRODUCTION

Illinois mineral production in 1964 was valued at 618 million dollars. This amount was the second highest total annual value ever recorded for mineral production in this state. The record high value of 631 million dollars was established in 1962. Although the total mineral value for 1964 was only slightly greater than the 615 million dollars worth of minerals reported for 1963, several of the major mineral commodities produced in 1964 showed a substantial increase over the corresponding 1963 values. These mineral products include coal, stone, cement, lime, common sand, and gravel. However, the values of oil, clay products, special sands, fluorspar, and metals all showed declines in 1964 from their 1963 values (tables 1 and 2).

The value of fuels produced in Illinois during 1964 amounted to about 67.1 percent of the value of all minerals. A decrease in the total value of these fuels—coal and crude oil and associated products—as compared to the 1963 value, amounted to about 5.3 million dollars. The decline in the value of oil, with associated products, amounted to about 16.9 million dollars in 1964. However, the increase in the value of coal produced in 1964 amounted to about 11.6 million dollars. For the year 1964, coal contributed about 33.6 percent of the state's total mineral value, and oil, with associated products, supplied about 33.5 percent of the Illinois overall mineral value.

Stone products produced in Illinois include crushed stone, cement, and lime and make up the second most important group of minerals produced in this state. The tonnage and total value of crushed stone reported produced by commercial operators during 1964 showed an increase of 7.6 percent and 9.5 percent respectively over the tonnage and value reported for 1963. Shipments of Portland and masonry cements increased in value in 1964 about 6.9 percent; the 1964 total value of lime amounted to an 11.1 percent increase over the 1963 value. As a group, these stone products—crushed stone, cement, and lime—contributed 16.4 percent of the state's total mineral value for 1964.

Illinois clay products, which includes such items as face brick and common brick, structural tile, drain and sewer tile, refractories, and pottery and whiteware, had a total reported value of 51.3 million dollars in 1964. This amount was about 4.8 percent less than the 53.9 million dollars worth of clay products reported for 1963. However, the 1964 production of clay products amounted to 8.3 percent of the state's overall mineral products value.

Common sand and gravel production in 1964 showed increases in total tonnage, total value, and average value per ton. The total value of special sands in Illinois in 1964 was almost the same as the 1963 value, which was 11.4 million dollars. Special sands include silica sand and natural bonded molding sand. In 1964 all sands and gravel furnished about 6.5 percent of the total Illinois mineral product value.

Fluorspar, lead, and zinc, which are produced from Illinois mines, had a combined value of about 10.7 million dollars in 1964. This amount was somewhat less than the 1963 total value of 11.8 million dollars. Although shipments of fluorspar in 1964 were slightly below the 1963 shipments, a small increase in the price per ton in 1964 brought the total value of this commodity up to nearly the same dollar value as the 1963 total. Sharp reductions in the tonnage output of lead and zinc in 1964 caused the total value of these metals to be considerably less than the 1963 value although an increase in the price per ton for each metal occurred during 1964. As a group, the total value of fluorspar, lead, and zinc was about 1.7 percent of the state's entire mineral value (tables 3 and 4).

COAL

Illinois coal production in 1964 amounted to more than 54.8 million tons and was valued at 207.8 million dollars. This tonnage output and total dollar value had not been equaled or exceeded since the year 1951 when coal production was about 35 thousand tons more than the 1964 production. The total value of the 1951 production amounted to about 223.3 million dollars, due not only to slightly more tonnage but also to a higher average value per ton as compared to the average value per ton in 1964. However, in 1951 there were 302 mines reporting coal production in 43 of the state's counties, but only 108 mines produced coal in 32 counties in 1964.

During 21 of the 35 years from 1930-1964 inclusive, the annual value of coal was the largest single value, among all minerals produced in Illinois. Coal was first in value for nine years, 1930-1938 inclusive, and for 11 years, 1943-1953 inclusive. In 1964 the value of coal was again the largest single amount among the values of all Illinois minerals and contributed about 33.6 percent to the state's total mineral value. For other years during the 35 year period, the value of oil held the dominant position.

Production

The record for Illinois coal production in 1964 is shown in tables 5 and 6. Table 5 summarizes production in terms of tons of coal produced, type of mine (strip or underground), number of mines, and the approximate value of the product for each producing county. Of the 32 counties reporting coal production for 1964, there were 13 that produced more than one million tons each for a combined total of 90 percent of the state's output. Recovery of coal by stripping methods was important in 18 of the producing counties in 1964 and accounted for about 54 percent of the total coal produced during the year.

The cumulative production of coal by counties since 1882, when mining records were begun, is shown in table 6. During this period of 83 years, more than 3.8 billion tons of coal have been taken from Illinois mines. Of the 71 counties that have recorded coal production since 1882, there are 12 that have produced more than 100 million tons of coal each, and as a group have accounted for 78 percent of the state's entire output. Table 6 also shows the total number of years that each county has produced coal since 1882 and the most recent year it was productive.

The 32 Illinois counties that produced coal in 1964 are indicated by the county map in figure 1, with the intensity of mining activity illustrated by the degree of shading.

PETROLEUM

Production of crude oil in Illinois for 1964 was estimated at 70,168,000 barrels, about a six percent decline from the 74,796,000 barrels produced in 1963. Peak production for Illinois oil occurred in 1940 when 147,647,000 barrels was produced after which production gradually declined to a low of about 59 million barrels in 1953. In 1954, through a combination of increased drilling and secondary recovery methods, the downward trend was reversed and production increased to the 1956 postwar high of 82.3 million barrels. Since 1956 oil production in Illinois has recorded an uneven decline to the 1964 production of just over 70 million barrels.

The value of crude oil produced in Illinois during 1964 amounted to about 205.6 million dollars. An estimated decrease of three cents per barrel in the average price and lower production made the value of Illinois oil, with natural gas and natural gas liquids, about 16.9 million dollars less than the 1963 total value. However, these products supplied about 33.5 percent of the state's total mineral value in 1964.

Production

The estimated amount and value of oil produced by county in 1964 and each county's percentage of the state total are given in table 7. This table also indicates the total estimated oil production for each county for the period 1888 through 1964. The map in figure 2 shows the 41 Illinois counties that produced oil in 1964 and indicates the major oil-producing areas.

Illinois oil production records, from 1930-1964 inclusive, show that the annual value of oil was less than the annual value of Illinois coal until the year 1939. During the four year period, 1939-1942, the annual value of oil was greater than the value of coal. Not until 1954 did the annual value of oil again exceed the value of coal. From 1954 through 1963, the value of oil for each year was more than the value of coal. However, in 1964 the value of coal produced in Illinois exceeded, by a small margin, the value of oil for that year.

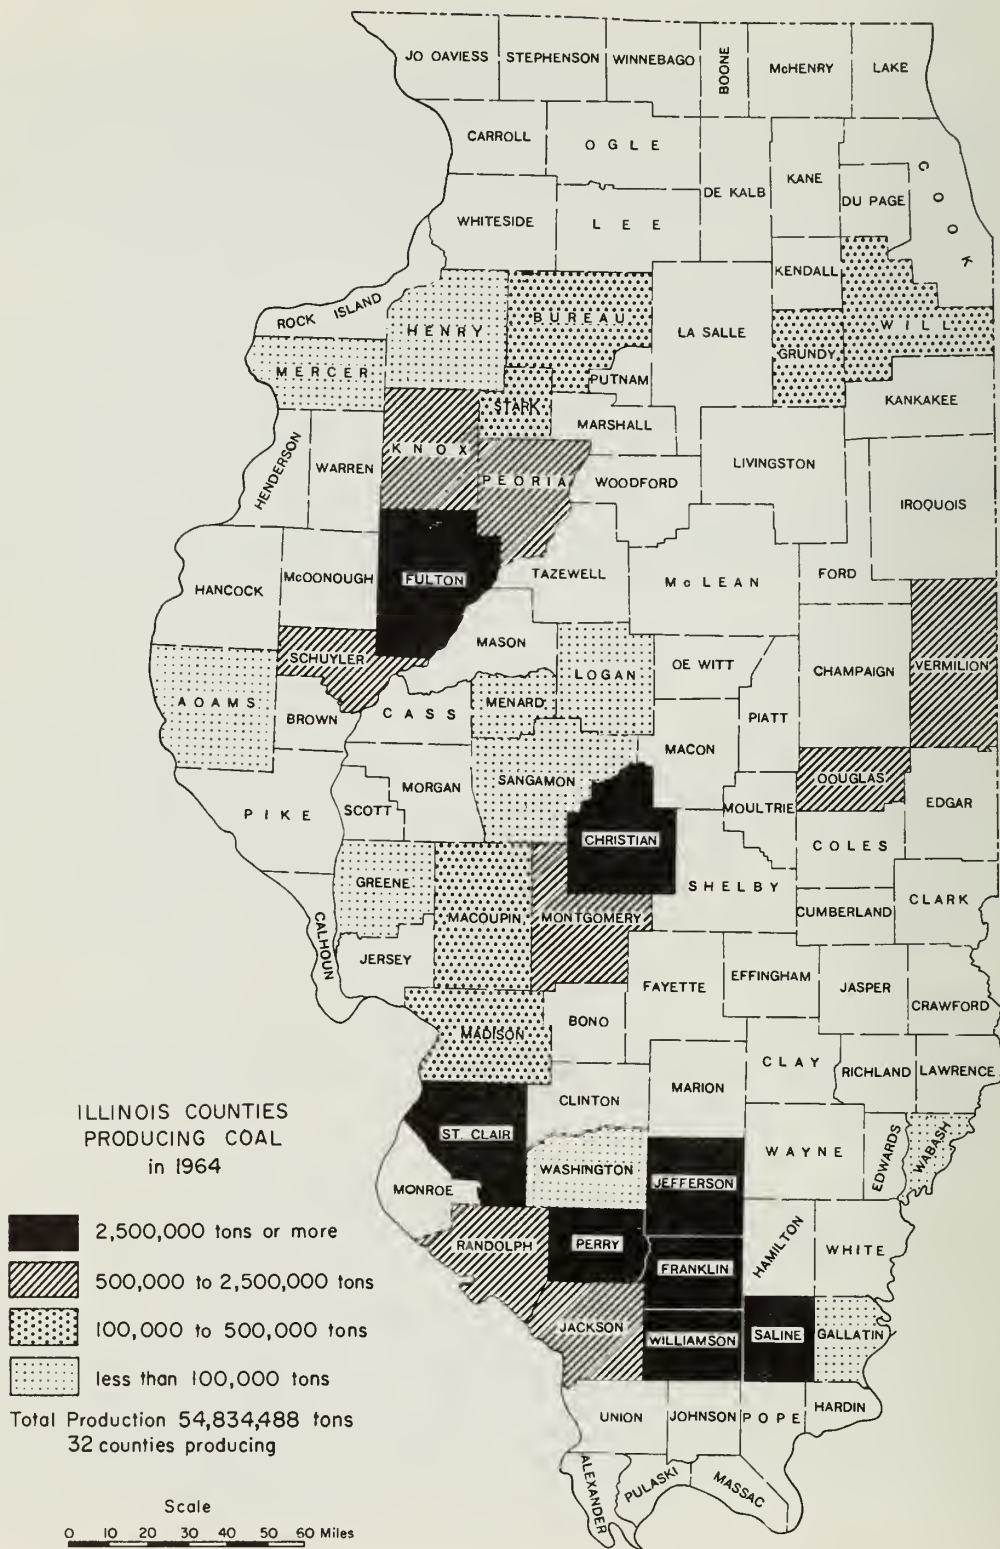

Figure 1 - Illinois coal production by counties in 1964.

Figure 2 - Illinois oil production by counties in 1964.

Figure 3 - County outline map of Illinois showing area division.

STONE, SAND, AND GRAVEL

Stone

Commercial quarry operators produced 38.6 million tons of crushed and broken stone in 1964, which was valued at 52.2 million dollars. The tonnage reported for 1964 was about 7.6 percent more than the 35.8 million tons reported for 1963. Greater stone production in 1964, plus a two-cent advance in the average value per ton, increased the total value of this product by 9.5 percent over the 1963 value of 47.7 million dollars. During 1964 seven Illinois counties—Cook, St. Clair, Kankakee, Will, Livingston, Rock Island, and Randolph—produced over one million tons of stone each for a combined total of 21.8 million tons, or 56 percent of the state's total stone production. In addition to the counties named above, there were ten counties with stone production ranging from one-half million to one million tons each for a combined total production of about 7.3 million tons of stone. This amount was about 19 percent of all stone produced in Illinois during 1964.

Table 8 gives a detailed accounting of stone production in Illinois according to region (fig. 3) and according to three major categories of use—stone for road and building, agriculture, and all other uses. Table 8 also lists every county reported to have had stone production and the average value at the quarry for all categories of stone in all regions for 1964.

Sand and Gravel

The production of common sand and gravel in Illinois during 1964 increased in total tons produced, in total value of product, and in the average price per ton for each commodity over the corresponding figures for 1963 (table 1). In 1964 the combined production of common sand and gravel amounted to 30.2 million tons as compared to a total of 27.1 million tons for 1963. The total value of these commodities was 28.5 million dollars for 1964 and 24.8 million dollars for 1963.

Common sand and gravel are used extensively in Illinois in the construction industry, in building and maintaining highway and railway roadbeds, and for many other uses. According to the production figures tabulated in table 9 (sand) and in table 10 (gravel), the Northeast Region of Illinois was the number one producer of these combined products in 1964 (fig. 3). The second most important region in the production of sand and gravel in 1964 was the Central Region, followed closely by the Northwest Region. Other regions in Illinois produced smaller, but important, tonnages of these materials during 1964.

Special Sands

Silica sand and natural bonded molding sand are the two special sands produced in Illinois. During 1964 silica sand was produced in substantial quantities in LaSalle County and in lesser amounts in Ogle County. According to the 1964 production figures shown in table 11, the most important single use for Illinois silica sand was in the manufacture of glass. The second most important use for the state's silica sand was for molding sand purposes. The footnotes of table 11 enumerate other uses for Illinois silica sand that require both ground and unground materials.

Natural bonded molding sand has been produced in relatively small quantities in Illinois for many years. The natural makeup of this sand is such that it can be used in molds for the casting of metals without the addition of a binding substance, such as clay, because the sand already contains the proportion of fine clay to make it suitable for molding use. Table 11 indicates that the production

of natural bonded molding sand in 1964 was about one-half the amount that was produced during 1963. In 1964 small amounts of natural bonded molding sand was produced in Henry, Fayette, Mason, and Rock Island Counties.

CLAY PRODUCTS

The value of clay products reported produced in Illinois during 1964 amounted to 51.3 million dollars. Although this total was about 4.8 percent less than the 53.9 million dollars worth of clay products reported for the year 1963, the 1964 figure represents about 8.3 percent of the state's overall mineral products value. Illinois clay products include such items as face brick and common brick, sewer pipe and drain tile, building tile, vitreous plumbing fixtures, electrical porcelains, pottery and whiteware, and lightweight aggregates. Also included in the list of Illinois clay products are the various forms of special heat-resistant fire brick and silica brick used by the metallurgical industries. A summary of the production of clay products for the years 1963 and 1964 is given in table 12. Fifty-one clay products plants located in 26 counties throughout Illinois reported production for 1964.

CEMENT

The production of cement in Illinois represents one of the larger mineral industries of this state. During 1964 the total value of this product, including Portland and masonry cements, amounted to more than 34.2 million dollars. This amount was an increase of 2.2 million dollars, or 6.9 percent, over the 32.0 million dollars worth of cement produced in 1963. Three counties contain the state's four cement plants: two in LaSalle County at Oglesby and at LaSalle; one in Lee County at Dixon; and one in Massac County at Joppa. Illinois cement plants shipped a total of over 10.3 million barrels of all types of cement in 1964 as compared to a total of 9.7 million barrels in 1963 (table 1).

FLUORSPAR

Illinois fluorspar producers shipped a total of 127,454 tons of finished fluorspar in 1964, which was about 58.7 percent of all finished fluorspar produced and shipped in the United States. Illinois, the nation's leading fluorspar producer, supplied about 14.2 percent of all fluorspar—about 900,000 tons of domestic and foreign material—consumed in the United States during 1964 (table 13).

Fluorspar, an important raw material for the iron and steel, aluminum, chemical, glass, and ceramics industries, was mined principally in Hardin County, with small amounts produced in Pope County, in the southern part of the state.

METALS

Zinc and lead are produced in Illinois from primary metal mines in Jo Daviess County, located in the northwestern part of the state, and as by-products of fluorspar mining in Hardin and Pope Counties in the southern part of Illinois.

Production figures for 1964 show that Illinois mines produced a total of 13,800 tons of zinc in 1964, which was valued at 3.7 million dollars. Illinois lead production amounted to 2,180 tons, with a value of \$571,160 for 1964 (table 14).

1963	20,337	4,677,510	2,901	626,616
1964	13,800	3,753,600	2,180	571,160

^a Mine production of recoverable metal.

^b Source: U. S. Bureau of Mines.

Table 15 of this report was designed as a quick and convenient reference to the counties in Illinois producing any of the 14 major mineral products of this state. The table indicates the different mineral products produced by any county in the state, and the numbers show the position held by each county among all counties producing a selected mineral product.

TABLE 15 - SUMMARY OF MINERALS PRODUCED BY ILLINOIS COUNTIES, 1964
